

## CLAIMS

What is claimed is:

1 1. In a system, a method of operation comprising:  
2 receiving a first plurality of signals wirelessly transmitted by a plurality of  
3 signal sources, employing a plurality of sensors;  
4 taking a first sample of the received signals sensed by the sensors;  
5 constructing a first received signal vector based on the first sample,  
6 employing a first plurality of signal directional vectors; and  
7 determining a first plurality of directions of arrival for the signals based at  
8 least in part on a relationship between the first received signal vector and the first  
9 plurality of signal directional vectors.

1 2. The method of claim 1, wherein  
2 the plurality of signals comprise  $J$  signals wirelessly transmitted by  $J$   
3 corresponding signal sources with center frequency  $f_0$ , the  $J$  signals traveling at  
4 speed  $c$  and impinging on the sensors from directions of arrival  $\theta_1, \dots, \theta_J$ ;  
5 said receiving comprises receiving the  $J$  signals employing  $N$  sensors with  
6 spacing  $d$ , where  $N$  is an integer greater than 1, and  
7 said constructing of a first received signal comprises constructing a first  
8 received signal vector ( $\mathbf{x}(t)$ ) given by

9 
$$\mathbf{x}(t) = \mathbf{A}\mathbf{s}(t) + \mathbf{n}(t)$$

10 where

11 
$$\mathbf{x}(t) = [x_1(t), \dots, x_J(t)]^T$$

12 
$$\mathbf{A} = [\mathbf{a}(\theta_1), \dots, \mathbf{a}(\theta_J)]$$

13                    $\mathbf{a}(\theta_j) = [1 \ e^{-ikd \cos \theta_j} \ \dots \ e^{-i(N-1)kd \cos \theta_j}]^T$ ,     $j = 1, \dots, J$ ,    are the signal  
14                   directional vectors,  
15                    $\mathbf{s}(n) = [s_1(n), \dots, s_J(n)]^T$  are complex envelopes of outputs at the  
16                   sensors, and  
17                    $k = 2\pi f_0 / c$ .

1   3.   The method of claim 2, wherein said determining of a first plurality of  
2   directions of arrival for the signals comprises determining  $\theta_1 \dots \theta_L$  based at least  
3   in part on  $\mathbf{a}(\theta_i)$  for  $i = 1 \dots J$  intersecting with a subspace spanned by the first  
4    $\mathbf{x}(t)$ .

1   4.   The method of claim 3, wherein said determining of the first plurality of  
2   directions of arrival for the signals further comprises computing  
3   a first coefficient  $r_{11} = \|\mathbf{x}(t)\|$ , and  
4   a first orthonormal vector  $\mathbf{q}_1 = \frac{\mathbf{x}(t)}{r_{11}}$ .

1   5.   The method of claim 4, wherein said determining of a first plurality of  
2   directions of arrival for the signals further comprises computing for  $\mathbf{a}(\sim \theta_i)$   
3   a second coefficient  $r_{12} = \mathbf{q}_1^H \mathbf{a}(\sim \theta_i)$ ,  
4   a second orthonormal vector  $\mathbf{q}_2 = \mathbf{a}(\sim \theta_i) - r_{12} \mathbf{q}_1$ , and  
5   a third coefficient  $r_{22} = \|\mathbf{q}_2^H \mathbf{a}(\sim \theta_i)\|$ ,  
6   where  $\sim \theta_i$  is a trial value for  $\theta_1 \dots \theta_J$ .

1   6.   The method of claim 5, wherein said determining of a first plurality of  
2   directions of arrival for the signals further comprises evaluating a function

3       $B(\theta) = \frac{1}{r_{22}}$  for  $\sim \theta_i$ , and determining whether the evaluation yields a peak value  
4      for the function.

1      7.      The method of claim 6, wherein said determining of a first plurality of  
2      directions of arrival for the signals further comprises repeating said computing,  
3      evaluating and determining whether the evaluation yields a peak value for the  
4      function, for  $J$  or more  $a(\sim \theta_i)$ , and setting  $J$  peak values as  $\theta_1 \dots \theta_J$ .

1      8.      The method of claim 1, wherein said determining of a first plurality of  
2      directions of arrival for the signals comprises determining the first plurality of  
3      directions of arrival based at least in part on the first plurality of signal directional  
4      vectors intersecting with a subspace spanned by the first received signal vector.

1      9.      The method of claim 1, wherein the method further comprises  
2      taking a second sample of the received signals sensed by the sensors;  
3      constructing a second received signal vector based on the second  
4      sample, employing a second plurality of signal directional vectors; and  
5      determining a second plurality of directions of arrival for the signals based  
6      at least in part on a relationship between the second received signal vector and  
7      the second plurality of signal directional vectors.

1      10.     The method of claim 9, wherein the method further comprises determining  
2      a third plurality of directions of arrival based at least in part on corresponding  
3      averages of the first and second plurality of directions of arrival.

1      11.     In a system, a method of operation comprising:

2 receiving a plurality of signals wireless transmitted by a plurality of signal  
3 sources, employing a plurality of sensors;  
4 determining a first plurality of directions of arrival for a first plurality of  
5 multipaths of a first of the signals; and  
6 obtaining the first received signal based at least in part on the determined  
7 first plurality of directions of arrival for the first plurality of multipaths of the first  
8 signal.

1 12. The method of claim 11, wherein  
2 the method further comprises determining a second plurality of directions  
3 of arrival for the signals; and  
4 said determining of the first plurality of directions of arrival for the first  
5 plurality of multipaths of the first signal comprises searching for the first plurality  
6 of directions of arrival for the first plurality of multipaths of the first signal in a  
7 direction range centered on the determined direction of arrival of the first signal.

1 13. The method of claim 11, wherein  
2 the method further comprises determining a correlation matrix for the  
3 signals, and determining a plurality of eigenvectors of the correlation matrix  
4 corresponding to the signals; and  
5 said determining of the second plurality of directions of arrivals for the  
6 signals, including the direction of arrival of the first signal, is performed based at  
7 least in part on the determined eigenvectors of the correlation matrix  
8 corresponding to the signals.

1 14. The method of claim 13, wherein said determining of the correlation matrix  
2 comprises averaging a plurality of sets of outer-products of a plurality of signal

3 plus noise vectors determined based on a plurality of corresponding snapshots of  
4 the signals sensed by the sensors.

1 15. The method of claim 11, wherein

2 said receiving of a plurality of signals comprises receiving  $J$  signals  
3 wirelessly transmitted by  $J$  signal sources, employing  $N$  sensors, where  $J$  and  $N$   
4 are integers, each greater than 1;

5 the  $j$ th transmitted signal is modeled as  $x_j(t) = s_j(t)e^{j(2\pi(2+\varphi_0))}$ ,  $s(t)$

6 being a base band signal, and  $\varphi_0$  being an initial phase; and

7 the received  $j$ th signal is given by  $x_j(t) = \sum_{l=1}^L R_{jl} e^{i2\pi(f_d \cos \theta_{jl} - f\tau_{jl})} s(t - \tau_{jl})$

8 where  $R_{jl}$  is the signal strength of the  $l$ th multipath of the  $j$ th signal,

9  $f_d \cos \theta_{jl}$  is a Doppler shift the  $l$ th multipath of the  $j$ th signal,

10  $f$  is a carrier frequency,

11  $s()$  is a base band signal,

12  $\tau_{jl} = r_{jl}/c$  is a time delay of the  $l$ th multipath of the  $j$ th signal,

13  $r_{jl}$  is a range of the  $l$ th multipath of the  $j$ th signal,

14  $c$  is speed of Electromagnetic wave, and

15  $\theta_{jl}$  is the direction of arrival of the  $l$ th multipath of the  $j$ th signal.

1 16. The method of claim 15, wherein

2 a response vector at the  $N$  sensor for a signal impinging from an angle  $\theta$  is

3 given by  $\mathbf{v}(\theta_{jl}) = [1 \quad e^{\frac{-i2\pi \cos \theta_{jl}}{\lambda}} \quad e^{\frac{i4\pi \cos \theta_{jl}}{\lambda}} \quad \dots \dots \quad e^{\frac{i2\pi(N-1)\cos \theta_{jl}}{\lambda}}]^T$ ; and

4 a baseband signal vector corresponding to the  $l$ th multipath of the  $j$ th  
5 signal impinging from an angle  $\theta_{jl}$  is given by

6  $\mathbf{x}_j(t) = \sum_{l=1}^L \mathbf{v}(\theta_{jl}) R_{jl} e^{i2\pi(f_d \cos \theta_{jl} - f\tau_{jl})} s(t - \tau_{jl})$

1 17. The method of claim 16, wherein said searching comprises computing for  
2 a search vector  $\{ \mathbf{v}(\theta_{jk_1}), \mathbf{v}(\theta_{jk_2}), \dots, \mathbf{v}(\theta_{jk_L}) \}$ ,  $\theta_{jk_l}$  being a search angle,

3  $r_{11} = \| \mathbf{v}(\theta_{jk_1}) \|_2$  and

4 
$$\mathbf{q}_1 = \frac{\mathbf{v}(\theta_{jk_1})}{r_{11}}$$

5  $\| \cdot \|_2$  is the 2-norm of the vector.

1 18. The method of claim 17, wherein said searching further comprises  
2 computing

3 
$$r_{il} = \mathbf{q}_i^H \mathbf{v}(\theta_{jk_l}); \quad 1 \leq i \leq l-1; \quad l = 2, \dots, L+1$$

4 
$$r_{ll} = \| \mathbf{v}(\theta_{jk_l}) - \sum_{i=1}^{l-1} r_{il} \mathbf{q}_i \|_2, \quad l = 2, \dots, L+1, \text{ and}$$

5 
$$\mathbf{q}_l = [\mathbf{v}(\theta_{jk_l}) - \sum_{i=1}^{l-1} r_{il} \mathbf{q}_i] / r_{ll}, \quad l = 2, \dots, L+1.$$

1 19. The method of claim 18, wherein said searching further comprises  
2 determining whether a function  $B(\Theta_j) = \frac{1}{r_{L+1,L+1}}$  yields a peak value, and if so,  
3 setting  $\Theta_j = \{\theta_{j1}, \dots, \theta_{jL}\}$  as the first directions of arrival of the first plurality of  
4 multipaths of the first signal.

1 20. The method of claim 11, wherein said obtaining of the first received signal  
2 comprises obtaining  $z(t)$  based on the determined directions of arrival of  $L$ -  
3 multipaths of the first received signal as follows

4 
$$z(t) = \sum_{l=1}^L \sum_{n=1}^N x_n w_{nl} \quad \text{where } w_{nl} = e^{-ikd(n-1)\cos\hat{\theta}_{jl}}$$

1 21. An apparatus comprising:  
2       storage medium having stored therein programming instructions designed  
3       to enable the apparatus to  
4           construct a first received signal vector employing a first plurality of  
5           signal directional vectors; based at least in part on a first sample of  
6           a plurality of received signals wirelessly transmitted by a plurality of  
7           signal sources, received employing a plurality of sensors; and  
8           determine a first plurality of directions of arrival for the signals based at  
9           least in part on a relationship between the first received signal  
10          vector and the first plurality of signal directional vectors; and  
11          at least one processor coupled to the storage medium to execute the  
12          programming instructions.

1 22. The apparatus of claim 21, wherein  
2       the plurality of signals comprise  $J$  signals wirelessly transmitted by  $J$   
3       corresponding signal sources with center frequency  $f_0$ , the  $J$  signals traveling at  
4       speed  $c$  and impinging on the sensors from directions of arrival  $\theta_1 \dots \theta_J$ ;  
5       the  $J$  signals are received employing  $N$  sensors with spacing  $d$ , where  $N$  is  
6       an integer greater than 1, and  
7       the programming instructions are designed to perform said constructing of  
8       a first received signal by constructing a first received signal vector ( $\mathbf{x}(t)$ ) given by

$$9 \quad \mathbf{x}(t) = \mathbf{A}\mathbf{s}(t) + \mathbf{n}(t)$$

10      where

$$11 \quad \mathbf{x}(t) = [x_1(t), \dots, x_J(t)]^T$$

$$12 \quad \mathbf{A} = [\mathbf{a}(\theta_1), \dots, \mathbf{a}(\theta_J)]$$

13                    $\mathbf{a}(\theta_j) = [1 \ e^{-ikd \cos \theta_j} \ \dots \ e^{-i(N-1)kd \cos \theta_j}]^T$ ,     $j = 1, \dots, J$ ,    are the signal  
14                   directional vectors,  
15                    $\mathbf{s}(n) = [s_1(n), \dots, s_J(n)]^T$  are complex envelopes of outputs at the  
16                   sensors, and  
17                    $k = 2\pi f_0 / c$ .

1   23.   The apparatus of claim 22, wherein the programming instructions are  
2   designed to perform said determining of a first plurality of directions of arrival for  
3   the signals by determining  $\theta_1, \dots, \theta_L$  based at least in part on  $\mathbf{a}(\theta_i)$  for  $i = 1 \dots J$   
4   intersecting with a subspace spanned by the first  $\mathbf{x}(t)$ .

1   24.   The apparatus of claim 23, wherein the programming instructions are  
2   further designed to perform as part of said determining, computing of  
3   a first coefficient  $r_{11} = \|\mathbf{x}(t)\|$ , and  
4   a first orthonormal vector  $\mathbf{q}_1 = \frac{\mathbf{x}(t)}{r_{11}}$ .

1   25.   The apparatus of claim 24, wherein the programming instructions are  
2   designed to perform as part of said determining, computing for  $\mathbf{a}(\sim \theta_i)$   
3   a second coefficient  $r_{12} = \mathbf{q}_1^H \mathbf{a}(\sim \theta_i)$ ,  
4   a second orthonormal vector  $\mathbf{q}_2 = \mathbf{a}(\sim \theta_i) - r_{12} \mathbf{q}_1$ , and  
5   a third coefficient  $r_{22} = \|\mathbf{q}_2^H \mathbf{a}(\sim \theta_i)\|$ ,  
6   where  $\sim \theta_i$  is a trial value for  $\theta_1 \dots \theta_J$ .

1   26.   The apparatus of claim 25, wherein the programming instructions are  
2   designed to perform as part of said determining, evaluation of a function

3       $B(\theta) = \frac{1}{r_{22}}$  for  $\sim \theta_i$ , and determination of whether the evaluation yields a peak  
4      value for the function.

1      27.     The apparatus claim 26, wherein the programming instructions are  
2      designed to perform as part of said determining, repeating of said computing,  
3      evaluation and determination of whether the evaluation yields a peak value for  
4      the function, for  $J$  or more  $a(\sim \theta_i)$ , and setting of  $J$  peak values as  $\theta_1 \dots \theta_J$ .

1      28.     The apparatus of claim 21, wherein the programming instructions are  
2      designed to perform as part of said determining, determination of the first plurality  
3      of directions of arrival based at least in part on the first plurality of signal  
4      directional vectors intersecting with a subspace spanned by the first received  
5      signal vector.

1      29.     The apparatus of claim 21, wherein the programming instructions are  
2      designed to perform  
3              construction of a second received signal vector based on the second  
4      sample, employing a second plurality of signal directional vectors, based at least  
5      in part on a second sample of the received signals sensed by the sensors; and  
6              determination of a second plurality of directions of arrival for the signals  
7      based at least in part on a relationship between the second received signal  
8      vector and the second plurality of signal directional vectors.

1      30.     The apparatus of claim 29, wherein the programming instructions are  
2      further designed to enable the apparatus to determine a third plurality of  
3      directions of arrival based at least in part on corresponding averages of the first  
4      and second plurality of directions of arrival.

1 31. An apparatus comprising:  
2       storage medium having a plurality of programming instructions designed  
3    to enable the apparatus to  
4        determine a first plurality of directions of arrival for a first plurality of  
5        multipaths of a first of a plurality of signals wireless transmitted by a  
6        plurality of signal sources, and received employing a plurality of  
7        sensors, and  
8        obtain the first received signal based at least in part on the determined  
9        first plurality of directions of arrival for the first plurality of multipaths  
10      of the first signal; and  
11      at least one processor coupled to the storage medium to execute the  
12      programming instructions.

1 32. The apparatus of claim 31, wherein  
2       the programming instructions are further designed to enable the apparatus  
3    to determine a second plurality of directions of arrival for the signals; and  
4       the programming instructions are designed to perform said determining of  
5    the first plurality of directions of arrival for the first plurality of multipaths of the  
6    first signal by searching for the first plurality of directions of arrival for the first  
7    plurality of multipaths of the first signal in a direction range centered on the  
8    determined direction of arrival of the first signal.

1 33. The apparatus of claim 31, wherein  
2       the programming instructions are further designed to enable the apparatus  
3    to determine a correlation matrix for the signals, and determine a plurality of  
4    eigenvectors of the correlation matrix corresponding to the signals; and

5       the programming instructions are designed to perform said determining of  
6   the second plurality of directions of arrivals for the signals, including the direction  
7   of arrival of the first signal, based at least in part on the determined eigenvectors  
8   of the correlation matrix corresponding to the signals.

1   34.   The apparatus of claim 33, wherein the programming instructions are  
2   designed to perform said determining of the correlation matrix by averaging a  
3   plurality of sets of outer-products of a plurality of signal plus noise vectors  
4   determined based on a plurality of corresponding snapshots of the signals  
5   sensed by the sensors.

1   35.   The apparatus of claim 31, wherein  
2        said receiving of a plurality of signals comprises receiving  $J$  signals  
3        wirelessly transmitted by  $J$  signal sources, employing  $N$  sensors, where  $J$  and  $N$   
4        are integers, each greater than 1;  
5        the  $j$ th transmitted signal is modeled as  $x_j(t) = s_j(t)e^{j(2\pi(2+\varphi_0))}$ ,  $s(t)$   
6        being a base band signal, and  $\varphi_0$  being an initial phase; and  
7        the received  $j$ th signal is given by  $x_j(t) = \sum_{l=1}^L R_{jl} e^{i2\pi(f_d \cos \theta_{jl} - f\tau_{jl})} s(t - \tau_{jl})$   
8        where  $R_{jl}$  is the signal strength of the  $l$ th multipath of the  $j$ th signal,  
9             $f_d \cos \theta_{jl}$  is a Doppler shift the  $l$ th multipath of the  $j$ th signal,  
10           $f$  is a carrier frequency,  
11           $s()$  is a base band signal,  
12           $\tau_{jl} = r_{jl}/c$  is a time delay of the  $l$ th multipath of the  $j$ th signal,  
13           $r_{jl}$  is a range of the  $l$ th multipath of the  $j$ th signal,  
14           $c$  is speed of Electromagnetic wave, and  
15           $\theta_{jl}$  is the direction of arrival of the  $l$ th multipath of the  $j$ th signal.

1 36. The apparatus of claim 35, wherein  
2 a response vector at the N sensor for a signal impinging from an angle  $\theta$  is  
3 given by  $\mathbf{v}(\theta_{jl}) = [1 \ e^{\frac{-i2\pi\cos\theta_{jl}}{\lambda}} \ e^{\frac{i4\pi\cos\theta_{jl}}{\lambda}} \ \dots \ e^{\frac{i2\pi(N-1)\cos\theta_{jl}}{\lambda}}]^T$ ; and

4 a baseband signal vector corresponding to the  $l$ th multipath of the  $j$ th  
5 signal impinging from an angle  $\theta_{jl}$  is given by

6 
$$\mathbf{x}_j(t) = \sum_{l=1}^L \mathbf{v}(\theta_{jl}) R_{jl} e^{i2\pi(f_d \cos\theta_{jl} - f\tau_{jl})} s(t - \tau_{jl})$$

1 37. The apparatus of claim 36, wherein the programming instructions are  
2 designed to perform as part of said searching, computation for a search vector  
3  $\{\mathbf{v}(\theta_{jk_1}), \mathbf{v}(\theta_{jk_2}), \dots, \mathbf{v}(\theta_{jk_L})\}$ ,  $\theta_{jk_l}$  being a search angle,

4  $r_{11} = \|\mathbf{v}(\theta_{jk_1})\|_2$  and

5 
$$\mathbf{q}_1 = \frac{\mathbf{v}(\theta_{jk_1})}{r_{11}}$$

6  $\|\cdot\|_2$  is the 2-norm of the vector.

1 38. The apparatus of claim 37, wherein the programming instructions are  
2 designed to perform as part of said searching, computation of  
3  $r_{il} = \mathbf{q}_i^H \mathbf{v}(\theta_{jk_l}); \quad 1 \leq i \leq l-1; \quad l = 2, \dots, L+1$

4 
$$r_{il} = \|\mathbf{v}(\theta_{jk_l}) - \sum_{i=1}^{l-1} r_{il} \mathbf{q}_i\|_2, \quad l = 2, \dots, L+1, \text{ and}$$

5 
$$\mathbf{q}_l = [\mathbf{v}(\theta_{jk_l}) - \sum_{i=1}^{l-1} r_{il} \mathbf{q}_i] / r_{ll}, \quad l = 2, \dots, L+1.$$

1 39. The apparatus of claim 38, wherein the programming instructions are  
2 designed to perform as part of said searching, determination of whether a

3 function  $B(\Theta_j) = \frac{1}{r_{L+1,L+1}}$  yields a peak value, and if so, set  $\Theta_j = \{\theta_{j1}, \dots, \theta_{jL}\}$  as the  
4 first directions of arrival of the first plurality of multipaths of the first signal.

1 40. The apparatus of claim 31, wherein the programming instructions are  
2 designed to perform said obtaining of the first received signal by obtaining  
3  $z(t)$  based on the determined directions of arrival of  $L$ -multipaths of the first  
4 received signal as follows

5 
$$z(t) = \sum_{l=1}^L \sum_{n=1}^N x_n w_{nl} \quad \text{where } w_{nl} = e^{-ikdn-1) \cos \hat{\theta}_{jl}}$$

1 41. A system comprising:  
2 a plurality of antennas to receive a plurality of signals wirelessly  
3 transmitted by a plurality of signal sources;  
4 a RF unit coupled to the antennas to down convert the received signals;  
5 and  
6 a direction of arrival estimation unit coupled to the RF unit, to  
7 construct a first received signal vector employing a first plurality of  
8 signal directional vectors; based at least in part on a first sample of  
9 the received signals; and  
10 determine a first plurality of directions of arrival for the signals based at  
11 least in part on a relationship between the first received signal  
12 vector and the first plurality of signal directional vectors.

1 42. The system of claim 41, wherein the direction of arrival estimation unit  
2 performs as part of said determination, determination of the first plurality of

3 directions of arrival based at least in part on the first plurality of signal directional  
4 vectors intersecting with a subspace spanned by the first received signal vector.

1 43. The system of claim 41, wherein the direction of arrival estimation unit  
2 further

3 constructs a second received signal vector employing a second plurality of  
4 signal directional vectors, based at least in part on a second sample of the  
5 received signals; and

6 determines a second plurality of directions of arrival for the signals based  
7 at least in part on a relationship between the second received signal vector and  
8 the second plurality of signal directional vectors.

1 44. The apparatus of claim 43, wherein the direction of arrival estimation unit  
2 further determines a third plurality of directions of arrival based at least in part on  
3 corresponding averages of the first and second plurality of directions of arrival.

1 45. A system comprising:

2 a plurality of antennas to receive a plurality of signals wirelessly  
3 transmitted by a plurality of signal sources;

4 a RF unit coupled to the antennas to down convert the received signals;  
5 and

6 a direction of arrival estimation unit coupled to the RF unit, to  
7 determine a first plurality of directions of arrival for a first plurality of  
8 multipaths of a first of a plurality of received signals wireless  
9 transmitted by a plurality of signal sources, and

10            obtain the first received signal based at least in part on the determined  
11            first plurality of directions of arrival for the first plurality of multipaths  
12            of the first signal.

1    46.   The system of claim 45, wherein the direction of arrival estimation unit  
2    further  
3        determines a second plurality of directions of arrival for the signals; and  
4        determines the first plurality of directions of arrival for the first plurality of  
5        multipaths of the first signal by searching for the first plurality of directions of  
6        arrival for the first plurality of multipaths of the first signal in a direction range  
7        centered on the determined direction of arrival of the first signal.

1    47.   The system of claim 45, wherein the direction of arrival estimation unit  
2    further  
3        determines a correlation matrix for the signals, and determines a plurality  
4        of eigenvectors of the correlation matrix corresponding to the signals; and  
5        determines the second plurality of directions of arrivals for the signals,  
6        including the direction of arrival of the first signal, based at least in part on the  
7        determined eigenvectors of the correlation matrix corresponding to the signals.

1    48.   The system of claim 47, wherein the direction of arrival estimation unit  
2        determines the correlation matrix by averaging a plurality of sets of outer-  
3        products of a plurality of signal plus noise vectors determined based on a  
4        plurality of corresponding snapshots of the received signals.

1    49.   An article of manufacture comprising

2 a machine readable medium having stored therein a plurality of  
3 programming instructions designed to enable an apparatus to be able to  
4 construct a first received signal vector employing a first plurality of  
5 signal directional vectors; based at least in part on a first sample of  
6 a plurality of received signals wirelessly transmitted by a plurality of  
7 sources; and  
8 determine a first plurality of directions of arrival for the signals based at  
9 least in part on a relationship between the first received signal  
10 vector and the first plurality of signal directional vectors.

1 50. The article of claim 49, wherein the programming instructions are  
2 designed to perform as part of said determination, determination of the first  
3 plurality of directions of arrival based at least in part on the first plurality of signal  
4 directional vectors intersecting with a subspace spanned by the first received  
5 signal vector.

1 51. An article of manufacture, comprising  
2 a machine readable medium having stored therein a plurality of  
3 programming instructions designed to enable an apparatus to  
4 determine a first plurality of directions of arrival for a first plurality of  
5 multipaths of a first of a plurality of received signals wireless  
6 transmitted by a plurality of signal sources, and  
7 obtain the first received signal based at least in part on the determined  
8 first plurality of directions of arrival for the first plurality of multipaths  
9 of the first signal.

1       52.    The article of claim 51, wherein the programming instructions are further  
2    designed to enable the apparatus to  
3        determine a second plurality of directions of arrival for the signals; and  
4        determine the first plurality of directions of arrival for the first plurality of  
5    multipaths of the first signal by searching for the first plurality of directions of  
6    arrival for the first plurality of multipaths of the first signal in a direction range  
7    centered on the determined direction of arrival of the first signal.
